

Prime Factorisation: Tree and Division Methods

Unit: Playing with Numbers - Student Practice Worksheet

Overview: Ms. Rao wrote 60 on the board and asked for its "prime building blocks" — the smallest prime numbers that multiply together to make it. Kabir drew branches splitting 60 into smaller and smaller pieces, like a family tree. Anaya divided 60 by primes one after another, straight down a column. Two completely different-looking methods — and they landed on the exact same four numbers.

Practice Questions (30 Total)

Section A - Easy

Q1. The tree leaves are 2, 3, 2 and 5. What is 60 as a product of primes?

- ☐ A. $2 \times 2 \times 3 \times 5$
- ☐ B. $2 \times 3 \times 5$
- ☐ C. $2 \times 3 \times 3 \times 5$
- ☐ D. $2 \times 2 \times 5 \times 5$

Q2. What is prime factorisation?

- ☐ A. Writing a number as a product of prime numbers
- ☐ B. Adding all the factors of a number
- ☐ C. Finding only the biggest factor
- ☐ D. Dividing a number by itself

Q3. What is the prime factorisation of 12?

- ☐ A. 2×6
- ☐ B. $2 \times 2 \times 3$
- ☐ C. 3×4

☐ D. 1×12

Q4. The column has just divided 60 by 2 to get 30. What is the next division-method step?

$$2 \mid 60$$

$$2 \mid 30$$

$$? \mid 15$$

- ☐ A. Stop here
- ☐ B. Multiply 30 by 2 again
- ☐ C. Add 30 and 2
- ☐ D. Divide 30 by the next fitting prime

Q5. In the division method, what do you divide by first?

- ☐ A. Any number you like
- ☐ B. The largest prime possible
- ☐ C. The smallest fitting prime
- ☐ D. The number 1

Q6. What is the prime factorisation of 20?

- ☐ A. 4×5
- ☐ B. $2 \times 2 \times 5$
- ☐ C. 2×10
- ☐ D. 1×20

Q7. The maroon mark is 2 on the line 0, 1, 2, 3. Which is the smallest prime?

- ☐ A. 0
- ☐ B. 1
- ☐ C. 2

☐ D. 3

Q8. In a factor tree, when do you stop splitting a branch?

- ☐ A. When you feel like it
- ☐ B. After exactly 3 splits
- ☐ C. When the number becomes 1
- ☐ D. When the branch reaches a prime number

Q9. What is the prime factorisation of 18?

- ☐ A. 2×9
- ☐ B. $2 \times 3 \times 3$
- ☐ C. 3×6
- ☐ D. 1×18

Q10. 1 divides every number, yet it is left out of prime factorisations. Why?

- ☐ A. No, since 1 is not prime
- ☐ B. Yes, always
- ☐ C. Only for even numbers
- ☐ D. Only for odd numbers

Section B - Medium

Q11. The tree splits 45 into 9 and 5, then 9 into 3 and 3. What is the prime factorisation?

- ☐ A. $3 \times 3 \times 5$
- ☐ B. 5×9
- ☐ C. 3×15
- ☐ D. 1×45

Q12. In the division method, why must you always divide by a PRIME number, not just any factor?

- ☐ A. It makes no real difference either way

- ☐ B. Because non-prime divisors are illegal in maths
- ☐ C. So the final list of divisors is itself the prime factorisation
- ☐ D. To make the working longer

Q13. Find the prime factorisation of 72.

- ☐ A. $2 \times 2 \times 3 \times 3$
- ☐ B. $2 \times 2 \times 2 \times 3 \times 3$
- ☐ C. $2 \times 3 \times 3 \times 3$
- ☐ D. $2 \times 2 \times 2 \times 9$

Q14. The 10-by-10 grid is 100 cells. Which prime factorisation is that?

$$100 = 2 \times 2 \times 5 \times 5$$

- ☐ A. 2×50
- ☐ B. 4×25
- ☐ C. 10×10
- ☐ D. $2 \times 2 \times 5 \times 5$

Q15. Two students find different-looking factor trees for the same number, 48. Will their final prime factorisations differ?

- ☐ A. Yes, trees always give different final answers
- ☐ B. No — the set of prime factors is always the same regardless of tree shape
- ☐ C. Only if one tree has more branches
- ☐ D. It depends on which student starts first

Q16. Anaya's division-method table for a number shows divisors 2, 2, 2, 5. What is the original number?

- ☐ A. 20
- ☐ B. 10
- ☐ C. 40
- ☐ D. 80

Q17. Four leaf-boxes show 2, 3, 3 and 5. What is 90 as a product of primes?

- ☐ A. $2 \times 3 \times 5$
- ☐ B. $2 \times 9 \times 5$
- ☐ C. $3 \times 3 \times 10$
- ☐ D. $2 \times 3 \times 3 \times 5$

Q18. Which of these is NOT a valid prime factorisation of 24?

- ☐ A. $2 \times 3 \times 4$
- ☐ B. $2 \times 2 \times 2 \times 3$
- ☐ C. $3 \times 2 \times 2 \times 2$
- ☐ D. $2 \times 2 \times 6$ broken further into $2 \times 2 \times 2 \times 3$

Q19. Find the prime factorisation of 50.

- ☐ A. 2×25
- ☐ B. $2 \times 5 \times 5$
- ☐ C. 5×10
- ☐ D. 1×50

Q20. Use a tree or the division column for 36, then check they match. What is the prime factorisation?

- ☐ A. $2 \times 2 \times 3 \times 3$
- ☐ B. $2 \times 2 \times 9$
- ☐ C. 4×9
- ☐ D. 6×6

Section C - Challenge

Q21. Seven boxes of 2 stand in a row. What is the prime factorisation of 128?

- ☐ A. $2 \times 2 \times 2 \times 2 \times 8$

- ☐ B. $4 \times 4 \times 8$
- ☐ C. 2×64
- ☐ D. $2 \times 2 \times 2 \times 2 \times 2 \times 2 \times 2$

Q22. Why is prime factorisation called 'unique' for every number?

- ☐ A. Every number has one fixed set of prime factors
- ☐ B. Because no two numbers can share any prime factors
- ☐ C. Because only prime numbers can be factorised
- ☐ D. It isn't actually unique

Q23. A number's prime factorisation is $2 \times 2 \times 3 \times 7$. What is the number?

- ☐ A. 42
- ☐ B. 84
- ☐ C. 56
- ☐ D. 168

Q24. The two rows are primes of 60 and 90. Which shared primes should Anaya multiply for the HCF?

60: 2, 2, 3, 5

90: 2, 3, 3, 5

keep one 2, one 3, one 5

- ☐ A. $2 \times 3 \times 5$
- ☐ B. $2 \times 2 \times 3 \times 3 \times 5$
- ☐ C. 2×3
- ☐ D. 3×5

Q25. Kabir claims a prime number's own prime factorisation is just itself, with no other factors. Is he right?

- ☐ A. No, two prime factors are required
- ☐ B. Only true for 2
- ☐ C. Yes, itself is its only prime factor
- ☐ D. Prime numbers cannot be factorised at all

Q26. A number has prime factorisation $2^3 \times 3^2$ (meaning $2 \times 2 \times 2 \times 3 \times 3$). What is the number?

- ☐ A. 72
- ☐ B. 36
- ☐ C. 48
- ☐ D. 108

Q27. The maroon card shows $5 \times 13 = 65$. Which starting split of 60 is wrong?

5×13

 = 65, not 60

- ☐ A. $60 = 6 \times 10$
- ☐ B. $60 = 4 \times 15$
- ☐ C. $60 = 5 \times 13$
- ☐ D. $60 = 2 \times 30$

Q28. A number's factor tree has a branch that mistakenly stops at 4 (not fully split). What is wrong with the resulting factorisation?

- ☐ A. Nothing is wrong, 4 can be a final leaf
- ☐ B. It's incomplete — 4 is not prime, so it must be split further into 2×2
- ☐ C. The whole tree must be redrawn from a different starting split
- ☐ D. The final number will be too small

Q29. Why does the division method always divide by primes in increasing order (2, then 3, then 5...)?

- ☐ A. It's just a habit with no mathematical reason
- ☐ B. Larger primes never divide any number
- ☐ C. The order must always be reversed
- ☐ D. Testing smallest primes first is an efficient, systematic way to make sure none are missed

Q30. 1 divides every number, but prime factorisation never includes it. Which reason matches the definition of a prime?

- ☐ A. 1 actually IS included, always
- ☐ B. 1 has only one factor, failing the definition
- ☐ C. Because 1 is too small to matter
- ☐ D. There is no real reason

Answer Key

Q1: (A) (a) $2 \times 2 \times 3 \times 5$, rearranging the tree's leaves in order.

Q2: (A) (a) Writing a number as a product of prime numbers.

Q3: (B) (b) $2 \times 2 \times 3$ — all prime factors.

Q4: (D) (d) Divide 30 by the next smallest prime that fits, continuing the process.

Q5: (C) (c) The smallest prime that divides it exactly.

Q6: (B) (b) $2 \times 2 \times 5$.

Q7: (C) (c) 2 — the smallest and only even prime number.

Q8: (D) (d) When the branch reaches a prime number.

Q9: (B) (b) $2 \times 3 \times 3$.

Q10: (A) (a) No, since 1 is not prime, it is never included.

Q11: (A) (a) $3 \times 3 \times 5$.

Q12: (C) (c) So the final list of divisors is itself the prime factorisation — dividing by non-primes would leave composite numbers in the answer.

Q13: (B) (b) $2 \times 2 \times 2 \times 3 \times 3 = 72$.

Q14: (D) (d) $2 \times 2 \times 5 \times 5 = 100$.

Q15: (B) (b) No — the set of prime factors is always the same regardless of tree shape, because prime factorisation is unique.

Q16: (C) (c) 40. $2 \times 2 \times 2 \times 5 = 40$.

Q17: (D) (d) $2 \times 3 \times 3 \times 5 = 90$.

Q18: (A) (a) $2 \times 3 \times 4$ — 4 is not prime, so this is not a full prime factorisation.

Q19: (B) (b) $2 \times 5 \times 5 = 50$.

Q20: (A) (a) $2 \times 2 \times 3 \times 3 = 36$.

Q21: (D) (d) $2 \times 2 \times 2 \times 2 \times 2 \times 2 \times 2$ — seven 2s, since $128 = 2^7$.

Q22: (A) (a) Because every number has exactly one set of prime factors, regardless of method used, this is called the Fundamental Theorem of Arithmetic.

Q23: (B) (b) 84. $2 \times 2 \times 3 \times 7 = 84$.

Q24: (A) (a) $2 \times 3 \times 5 = 30$ — take each prime at its LOWEST shared power across both factorisations.

Q25: (C) (c) Yes — a prime number's only prime factor is itself, since it has no smaller factors besides 1.

Q26: (A) (a) 72. $2 \times 2 \times 2 \times 3 \times 3 = 8 \times 9 = 72$.

Q27: (C) (c) $60 = 5 \times 13$ — since $5 \times 13 = 65$, not 60, this split is simply arithmetically wrong.

Q28: (B) (b) It's incomplete — 4 is not prime, so it must be split further into 2×2 before the tree is done.

Q29: (D) (d) Testing smallest primes first is an efficient, systematic way to make sure none are missed, though any valid order that only uses primes would still work.

Q30: (B) (b) Because 1 has only one factor (itself), not two, so it fails the definition of a prime number and is excluded by convention.

You've got this! Keep learning and shining! - Ruchi Math Coaching
